1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-11 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. "Monitor for monitoring a spectrum of the dropped optical signal within a modulation band per channel" is unclear. Are you monitoring a spectrum or per channel? How is this done?

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-2 and 9-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Monnard et al (6633430).

Monnard et al teach a drop portion (from 28c or 28d in figure 9) which he monitors in order to provide compensation to variable optical attenuators in order to flatten the output spectrum (column 5, lines 50-54). He monitors the signal (elements 96, figure 9) and uses a controller (52, figures 9 and 18). In that he monitors the signals and uses controller to compensate for the spectrum flatness, he obviously uses the monitor and control means to determine what flatness is required and controls the VOAs accordingly. In regard to claim 2, see figure 1, he shows the boost amplifier as part of the transmission side. In regard to claim 9, see figure 12. In regard to claims

Art Unit: 2613

10-11, in that the variable optical attenuators act to variably pass the signals, they are considered to be variable pass characteristic compensators.

5. Claims 3-8 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, 2nd paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.
